Executive Summary

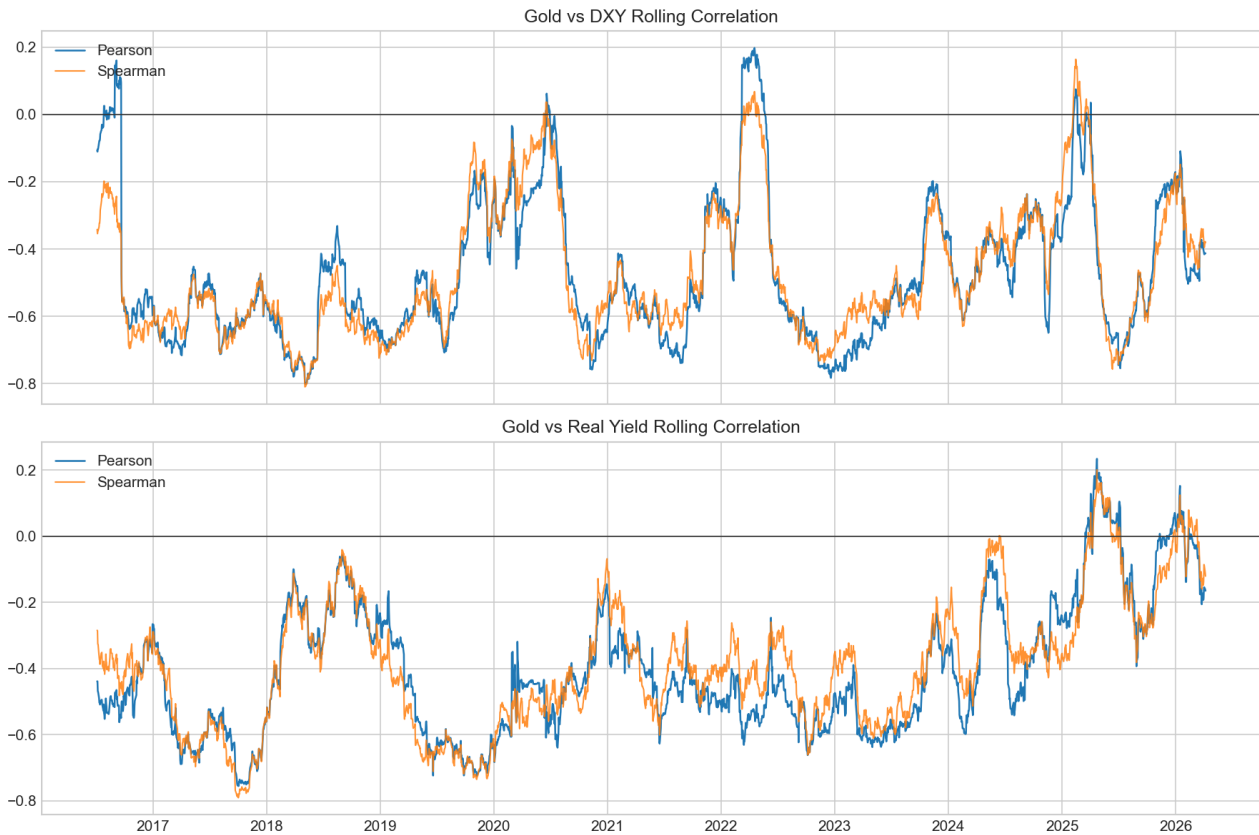

Gold closed near 4686.60 with the dual moving-average filter currently reading 1. The 21-day realized volatility is 31.05%, indicating a high volatility regime.

Market Overview

Macro Factor Analysis

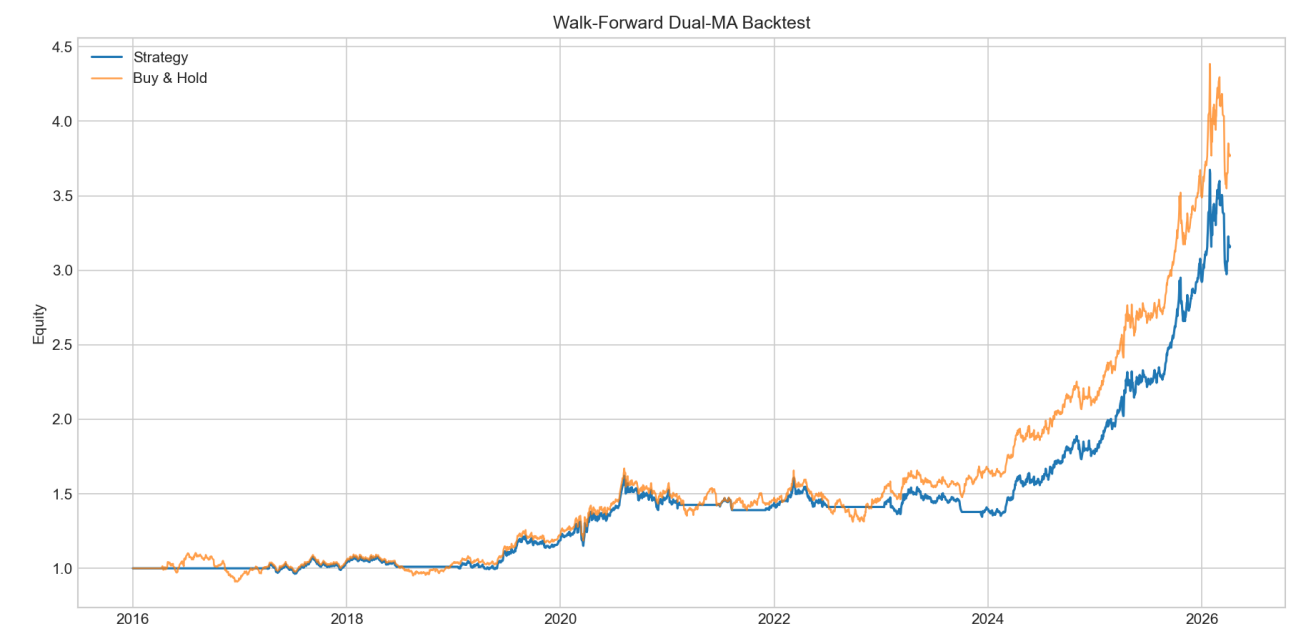

The latest 63-day Pearson correlation between gold and DXY is -0.413, while the correlation with real-yield changes is -0.165. The regression beta on DXY is -0.849 and the beta on real yields is -5.208, with R-squared 0.237.

Term	Coefficient	t-stat
const	0.001	3.290
dxy_log_return	-0.849	-19.409
real_yield_change	-5.208	-13.744

Quantitative Signal Review

The walk-forward trend strategy delivered an annualized return of 11.44%, a Sharpe ratio of 0.847, and a maximum drawdown of -19.08%. Monthly hit rate was 43.55%.

Metric	Value	Comment
Annualized Return	11.44%	Walk-forward out-of-sample
Sharpe Ratio	0.847	Daily returns annualized
Maximum Drawdown	-19.08%	Peak-to-trough decline
Monthly Hit Rate	43.55%	Share of positive months

Risk & Limitations

This is a single-asset, single-strategy backtest with no diversification benefit.

Dual moving-average crossovers are widely known and unlikely to represent durable alpha.

No transaction costs or slippage are modeled, so realized implementation performance may be worse.

Signal parameters were selected with historical knowledge, so data-snooping risk remains.

The LLM layer describes structured outputs and does not make forecasts.

Free data sources can contain revisions, gaps, or symbol-specific inconsistencies.

This narrative is template-generated because no Anthropic API key was supplied. It only summarizes observed statistics and should not be treated as a forecast.

Appendix

Data sources include Yahoo Finance, FRED, and optional AkShare SGE data.

Primary asset: GC=F; flow proxy: GLD.

Latest volatility regime: high.

LLM narrative mode: fallback.

Shanghai gold extension status: ok.
